

IN THE CLAIMS:

1. (currently amended) A system for exhausting gas via a nozzle, comprising:
a nozzle comprising a nozzle body portion defining a nozzle exit,
characterised in that the nozzle body portion comprises fluid injection means,
positioned upstream of the exit relative to a fluid flow created by the operation of
the system, for injecting fluid upstream of the exit to disturb a boundary layer
between the nozzle body portion and a fluid flow created by the operation of the
system.
2. (original) A system as claimed in claim 1 wherein the nozzle body portion
further defines a nozzle flow channel leading to the nozzle exit, wherein the fluid
injection means is positioned for injecting fluid within the nozzle flow channel.
3. (original) A system as claimed in claim 1 wherein the nozzle has an exterior
surface and the fluid injection means is positioned for injecting fluid at the exterior
surface of the nozzle upstream of the exit.
4. (previously presented) A system as claimed in claim 1 wherein the fluid
injection means comprises one or more apertures in the outer surface or
surfaces of a nozzle body for providing fluid jet means.
5. (previously presented) A system as claimed in claim 4 wherein the apertures
are positioned upstream of the exit.
6. (previously presented) A system as claimed in claim 4 further comprising
means for providing the fluid jet means via the apertures during operation of the
system.
7. (previously presented) A system as claimed in claim 4 further comprising
pulsing means for pulsing the fluid jet means.
8. (previously presented) A system as claimed in claim 7 wherein the pulsing
means pulses the fluid jet means at a selected frequency.
9. (previously presented) A system as claimed in claim 7, wherein the pulsing
means are controllable to vary the frequency at which said fluid jet means are
pulsed.

10. (previously presented) A system as claimed in claim 4, further comprising means for altering the mass flow of the fluid jet means.
11. (previously presented) A system as claimed in claim 4 wherein the mass flow rate of the fluid jet means when operational, is fixed.
12. (previously presented) A system as claimed in claim 4, wherein the apertures have a fixed position and further comprising means for varying the position of fluid jet means by providing fluid jets via selected apertures only.
13. (original) A system as claimed in claim 1 wherein the fluid injection means creates microjets of fluid.
14. (original) A system as claimed in claim 1 for use as an aeroplane engine, wherein the nozzle body tapers to an edge at an exit.
15. (original) A system as claimed in claim 1, for use as an aeroplane engine, further comprising means for controlling the injection means to inject fluid during take-off of the aeroplane but not to inject fluid when cruising.
16. (previously cancelled).
17. (original) A system for exhausting gas via a nozzle, comprising:
 - a nozzle comprising a nozzle body portion defining a nozzle exit, characterised in that the nozzle body portion comprises output means, positioned upstream of the exit relative to a fluid flow created by the operation of the system, for disturbing a boundary layer between the nozzle body portion and the fluid flow.
18. (previously presented) A system as claimed in claim 17, wherein the output means comprises fluid injection means for injecting fluid upstream of the exit.
19. (original) A system as claimed in claim 18, wherein the fluid injection means comprises a plurality of apertures for providing fluid microjets.
20. (original) A system as claimed in claim 19, further comprising pulse means for pulsing the fluid microjets.
21. (previously cancelled).
22. (currently amended) A system for exhausting gas via a nozzle from an engine having two phases of operation, comprising:
 - a nozzle, the nozzle comprising a nozzle body portion comprising fluid

injection means for injecting fluid characterised in that the system further comprises control means for controlling the fluid injection means to inject fluid during [[a]] the first phase of operation and to not inject fluid during [[a]] the second phase of operation.

23. (original) A system as claimed in claim 22 wherein the first phase is at least a part of the take-off phase of an aeroplane flight.

24. (original) A system as claimed in claim 22 wherein the second phase is at least a part of the cruising phase of an aeroplane plane flight.

25. (previously cancelled).
